Executive Summary

Purpose (context and justification)

The Project Objective of the UNEP/GEF funded Cameroon Biosecurity Project (*Development and Institution of a National Monitoring and Control System (Framework) for Living Modified Organisms (LMOs) and Invasive Alien Species (IAS)*) being executed by MINEPDED is to Increase capacity to prevent and control the introduction, establishment and spread of Invasive Alien Species (IAS) and management of LMOs in Cameroon through the implementation of a risk-based decision making process.

Within this context of a risk-based biosecurity approach the project advocates using the 'invasive management hierarchy' when planning invasive species management. This concept states that prevention is better than early detection and rapid response, which is better than eradication, which is better than control and mitigation. However, in many cases a biological invader is already established so prevention is not an option. In most such cases eradication is not feasible either.

Currently management strategies for established biological invasions in Cameroon are rarely based on a systematic risk-based decision-making process. The work documented in this report seeks to address this weakness by facilitating a generic risk-based decision-making processes that can be used to derive management options for established biological invasions in Cameroon. This objective is to be achieved by the production of a decision-making tool to address established biological invasions.

Objectives

When faced with an established biological invasion, those managing the invaded system (whether this system is a lake, field or a human or animal body) must decide upon which course of action to take. The objective of Project Activity 2.3.7. (*Decision-making Process to Address Established Biological invasions in Cameroon*) is to produce a simple aide memoire and accompanying manual to facilitate this decision-making process. The users of this 'Decision-making Tool for Established Invaders' are those responsible for the management of risks posed to human, animal and plant life and health and associated risks to the environment, across all ecosystems (land, freshwater and marine), and all sectors, from the harmful effects of biological invasions (from indigenous, introduced and new organisms) regardless of species (e.g. insects,

diseases, weeds, pathogens, and invasive animals) or whether they are LMOs or non-LMOs (though it must be stated that there is so far no known example of an LMO that has become an invasive species).

It is essential that the tool is compatible with international best practice, applicable to the situation in Cameroon, simple to use, brief and useable in the field. A single laminated A4 sheet is ideal. However, it is not possible to summarise all the information required in so little space. Therefore the tool needs to be accompanied by a user manual. The production of the manual was also part of this activity.

Methodology

In conformity with the objective of producing a tool applicable to Cameroon, inputs were obtained from national experts. In addition the draft tool was examined by stakeholders on the ground who are affected by established invaders in order to understand how applicable the tool is to real situations in Cameroon.

The initial step was a search for information from books, scientific publications and relevant websites which could provide international best practice inputs into the decision-making tool for Cameroon and to see was to see if any similar decision-making tools had been produced elsewhere.

The literature search provided background information for a stakeholder brainstorming session with national experts on biological invasions on the factors that need to be considered when managing established invaders.

The expert feedback was used to produce the two-sided aid memoire ('the Decision-making Tool') and the accompanying user manual. The draft tool and manual were circulated to stakeholders in two locations: a) in Tadu close to Kumbo in the North-West Region of Cameroon where bracken fern or fougère aigle (*Pteridium aquilinum*) is considered to be a major invader of rangeland systems; and b) in and around Douala where water hyacinth or jacinthe d'eau (*Eichhornia crassipes*) is considered to be a major invader of freshwater ecosystems.

The tool and manual were redrafted to incorporate stakeholder feedback. Additional updates were made following feedback received from the Component 2 Task Team during their examination of the first draft consultancy report.

Results

No “off the shelf” tools could be found that conformed to the consultancy objectives. However, the consultants did find a great deal of valuable information which informed the process by which the tool was produced.

From the brainstorming exercise with national experts ten factors that need to be considered when managing established invaders were agreed upon.

The stakeholders consulted in Tadu and in and around Douala were very positive about the value of the decision-making tool for their planned management actions. There were no major recommended changes, so the tool and manual remained substantially the same as the draft version.

The consultants received valuable feedback from the Component 2 Task Team’s review of the draft tool and manual including:

- The need to make the tool more generic so that it is clear that it can be used for species in all taxa, for all sectors and for both LMOs and non-LMOs
- The need to clarify how the information obtained can be transcribed.
- The need to clarify how the information obtained can be translated into concrete action.

The feedback was incorporated into a finalised list of the following eleven factors to be considered when planning the management of an established invader:

1. Management objectives for the desired entity affected by an invasion – field, watershed, park, person or animal, etc.
2. Quality/health of the entity Independent of the Biological Invasion
3. Negative impacts of the biological invasion on management objectives
4. Identification of the biological invader to species level or below
5. Legal and institutional issues that need to be considered when managing the biological invasion
6. Stakeholders and stakes/interests;
7. Management techniques, capacity and resources
8. Threats and risks of management actions (non-target or side-effects)
9. Monitoring, evaluation, learning and planning.
10. Other issues not accounted for above that need to be addressed
11. Next Actions: further actions required to build upon the information gathered.

In the Tool each factor is followed by a series of questions as shown in the excerpt below

1. Management Objectives for the desired entity affected by an invasion – field, watershed, park, person or animal, etc.

a. Do users/managers have clear management objectives?	yes	No	Don't know	
--	-----	----	------------	--

- If *yes* then list the management objectives for the site? e.g. crop yield, fish catch, biodiversity conservation, quality of life, etc.
- If *no* then management objectives need to be clarified

1.b. Changes in Management Objectives:

Could management objectives change in a way that may affect the negative impact of a biological invasion in the foreseeable future?	yes	No	Don't know	
---	-----	----	------------	--

- If *yes* then consider how these changes may affect biological invasions management activities
- If *no* then this issue can be ignored

Figure ES-1: Excerpt from the Decision-making Tool demonstrating its structure

Every factor listed does not have to be addressed for all biological invasions but thinking about the factors and the questions asked can help to ensure that a comprehensive range of issues are considered in the planning and decision-making process. Equally, there are likely to be a number of issues not considered in the tool that will need to be addressed in some instances, so the factors and questions outlined in the tool should not be taken to be exhaustive.

Many of the questions have three possible answers – ‘yes’, ‘no’, or ‘don’t know’. Follow-up questions/instructions are often given for the ‘yes’ or ‘no’ responses but not the ‘don’t knows’. The standard response to a ‘don’t know’ answer is that more information is needed, *if the issue is considered to be important*.

The accompanying manual contains supporting information for managers to enable them to understand the rationale behind the factors considered, the questions asked, and the actions taken as a result of the responses given. In addition the manual contains sources of further information and a blank datasheet that can be used for transcription of information. This datasheet is a specimen only and should be adapted as needed for the biological invasion in question.

To clarify how the information obtained can be translated into concrete action, two preliminary case studies have been annexed to this report. Case Study 1: Bracken Fern in Tadu, and Case Study 2: Water hyacinth in the Douala area.

Recommendations/ Lessons learnt

Although the Decision-making Tool is designed to be simple it was not so easy for those in the field to focus on the details it contained during the meeting held to examine it although they were enthusiastic about its overall value. It is a practical tool and so its utility will be most

effectively assessed through its use in the field as part of the Action Learning Cycle of: action => reflection => learning => planning leading to further action.

It was also clear that a certain amount of training will be needed for managers to effectively use the tool. This training can be provided to pilot site managers under the CBP.

Next Steps in conformity with the CBP logframe

The following next steps will be taken to build on the outputs of this activity:

- Use of the Decision-making Tool in Activity 2.3.8. - *Pilot site, sectoral agencies and civil society management interventions using agreed decision making processes*. The tool can be used to help guide management actions in terms of the formulation, implementation and monitoring and evaluation of management plans.
- Incorporation of the Decision-making Tool and Manual into the *National Training Manual for invasive species control systems and procedures (systems approach utilising the most appropriate combination of methods e.g. manual, chemical, biological, cultural and other approaches to mitigation)* (Activity 3.1.11) and incorporate training in the use of the tool in appropriate national training activities¹.
- Adapt the Decision-making Tool and Manual into communications products under: *the development and implementation of the Biosecurity communications and awareness raising plan developed and implemented through existing agencies* (Activities 4.2.1. and 4.2.2.).
- Utilise the factors in the Decision-making Tool as a basis for the assessment of the efficiency and effectiveness of relevant project interventions (notably pilot site work) as part of the: *implementation of the Project Benefit Monitoring and Evaluation (PBME) System* (Activity 5.3.1.).

¹ At the time of writing national training in biological invasions under the CBP has already taken place and it was not clear if the training was going to be repeated under the project.
